ABSTRACT

A hydroethanolic extract (HE-ext) of Bacopa monnieri (BM) was studied for antinociceptive effect in the animal models of acetic-acid-induced writhing test and antilocomotive effect in mice. Standard centrally-acting analgesic, morphine (MP), and peripherally-acting one, diclofenac (Dico), were also tested along with the extract for comparison. The extract exhibited significant antinociceptive effect (p < 0.001) in this test, not antagonized by the opioid receptor antagonist, naloxone (NLX) in a fashion similar to diclofenac. This excluded the involvement of opioids in the mediation of antinociceptive response of Bacopa monnieri. Moreover, the BM HE-ext exhibited highly significant antilocomotive (p < 0.0001) that was also unaffected by naloxone. These results indicate that Bacopa monnieri possesses antinociceptive and antilocomotive effect that may be mediated through non-opioidergic mechanism.

Keywords: Bacopa monnieri, Hydroethanolic extract, Antinociceptive activity, Acetic-acid-induced writhing test, Antilocomotive effect

MATERIALS AND METHODS

Bacopa monnieri (family: Scrophulariaceae) [1] also known as Bacopa monniera, water hyssop, Herpestis monnieri is a perennial creeping, succulent herb found in marshy areas of Indo-Pak subcontinent [2]. In India, it is commonly known as “Brahmi” as an ancient and renowned medicinal plant with legendary reputation as a memory vitalizer [3]. Bacopa monnieri is held in high repute to be the brain booster and is highly valued in conditions affecting CNS. In ancient traditional system of medicine, it is often prescribed for epilepsy, insomnia, and psychiatric disorders such as mental breakdown in Alzheimer’s disease [4], neuralgia, and memory loss [5]. It is known to possess cardiotonic, sedative, analgesic, anticonvulsant, anti-inflammatory [6], antioxidant [7], anticancer, antipyretic, laxative, diuretic, antistress [8], and anxiolytic [9] properties. In this study, we have examined Bacopa monnieri for antinociceptive and antilocomotive activity in animal models.

**Chemicals and Drugs**

Ethanol was obtained from Khazana Sugar Mills Mardan through proper channel. Diclofenac sodium was gratefully donated by Zinta Pharmaceutical Pvt, Peshawar, Pakistan. Morphine was secured through proper channel (PDH Lahore, Pakistan). Opioid antagonist, naloxone was purchased from Sigma, USA.

For experiments, all drugs and extracts were dissolved in water for injection.

**Animals**

Balb-C mice bred in the animal house of the Department of Pharmacy, University of Peshawar, were used in this study. Animals were housed in groups of eight in cages with sawdust bedding. Experiments were carried out during the light phase between 9.00 am and 3.00 pm strictly in accordance with procedures laid down under the Animal Scientific Procedure Act (1986). Both anti-nociceptive and locomotive studies were carried out on mice of either sex weighing 18-22 g. Control animals received equal volume of normal saline (0.9% NaCl). Animals were marked for their proper identification.

**Procedures**

Acetic-acid-induced writhing test

Balb-C mice of either sex (n=8) weighing 18-22 g were used. Animals were withdrawn from food and water 2 hours before the start of experiment. Writhing behavior was tested, in which 1% acetic acid (AA) was administered i.p. and number of spontaneous abdominal constrictions occurring over the period of 20 minutes were counted just after 1% AA (10 mL/kg) administration. All drugs were administered in the volume of 0.1 mL/20 g i.p. and 0.1 mL/20 g s.c.

% Protection = (1 - Mean no. of abdominal constrictions of treated drug / Mean no. of abdominal constrictions of control) * 100

**Results**

Antinociceptive effect of morphine, diclofenac and hydroethanolic extract of *Bacopa monnieri* in acetic-acid-induced writhing test

As shown in the Fig 1, hydroethanolic extract (80, 160 mg/kg) were administered orally (PO) 1 hour before *Bacopa monnieri* (80, 160 mg/Kg Body weight), administering 1% AA. For antagonism, naloxone (0.5 mg/kg body weight) was administered subcutaneously (s.c.) 5 minutes before AA administration. All drugs were administered in the volume of 0.1 mL/20 g i.p and 0.2 mL/10 g PO. Percent analgesia was calculated with the help of following formula:

% Protection = (1 - Mean no. of abdominal constrictions of treated drug / Mean no. of abdominal constrictions of control) * 100

**Locomotor activity**

Balb-C mice of either sex (n=8) weighing 22 ± 2 g were used. Animals were acclimatized under red light (40 Watt red bulb) one hour before the start of experiment in laboratory with food and water available *ad libitum*. The locomotor activity arena measured 50 x 40 cm and the floor was divided by lines into 4 equal-sized rectangular zones. Doses of BM HE-ext (80 mg/kg), or morphine (10 mg/kg), or saline were administered intraperitoneally and animals were placed in the recording apparatus 30 minutes later. Group mean line crossing counts were subsequently recorded between 1- 30 mins. For antagonism, naloxone (0.25 mg/kg) was administered s.c. 25 minutes after drug administration. All drugs were administered in the volume of 0.1 mL/10 g i.p and 0.1 mL/20 g s.c.

**Statistical analysis**

Results were analyzed by one-way analysis of variance (ANOVA) with post hoc tests for multiple comparisons and Student’s t test. Effects were considered significant at p < 0.05.

**Fig 1.** Antinociceptive effect of diclofenac, morphine and hydroethanolic extract of *Bacopa monnieri* calculated as percent protection in acetic acid induced writhing test in mice. Each column represents mean ± S.E.M. (n=8). **p < 0.01, ***p < 0.001. Difference between treatment groups and saline control was analyzed by one way analysis of variance with Dunnett’s post-hoc test.

**Fig 2.** The effect of naloxone on morphine and diclofenac induced antinociception calculated as percent protection in acetic acid induced writhing test in mice. Each column represents the mean ± S.E.M. (n=8). **p < 0.01, values showed significant antagonism by naloxone as compared to morphine treated groups when analyzed by Student’s t test.
Antinociceptive/Antilocomotive *B. monnieri*  

Effect of morphine and hydroethanolic extract of *Bacopa monnieri* after acute administration on locomotor activity in mice. Each column denotes mean line crossings ± S.E.M. (n=8). Student's t-test revealed significant difference between two comparison groups (**p < 0.01).

**DISCUSSION**

The nociceptive response in the acetic-acid-induced writhing test results from the liberation of histamine, 5-hydroxytryptamine, Prostaglandins, serotonin and substance P. The nociceptive activity of acetic acid may be due to cytokine release, such as TNF-α, interleukin-1β and interleukin-8, by resident peritoneal macrophages and mast cells [12]. It has been reported that intraperitoneal administration of acetic acid causes an increase in the concentration of glutamate and aspartate in the cerebrospinal fluid [13].

The production of prostaglandins [14,15] results through the action of the constitutive enzyme cyclooxygenase-1 (COX-1) and its isof orm COX-2 which produce pain [15,16]. Induction of this mechanism through COX enzymes and stimulation of these sensory pathways in the mouse peritoneum incites a viscerosomatic reflex and the abdominal constrictions observed in response to an algogenic agent such as acetic acid [15,16]. Acetic-acid-induced writhing assay is sensitive procedure to evaluate peripherally and centrally mediated analgesic activity.

**Fig 3.** Effect of naloxone on BM HE-extract induced antinociception calculated as percent protection in acetic acid induced writhing test in mice. Each column represents mean ± S.E.M. (n=8). Student's t-test revealed no significant difference between two comparison groups (p > 0.05).

**Effect of acute administration of morphine and hydroethanolic extract of *Bacopa monnieri* on locomotor activity in mice**

As depicted in the Fig 4, acute administration of morphine (10 mg/Kg, i.p.) or hydroethanolic extract (80 mg/Kg, i.p.) significantly reduced locomotor activity when compared to control (***p < 0.0001).

**Effect of naloxone pretreatment on morphine and hydroethanolic extract of *Bacopa monnieri* induced locomotor activity in mice**

As shown in the Fig 5, in contrast to morphine (10 mg/Kg B.w.), the antilocomotive effect of hydroethanolic extract of *Bacopa monnieri* (80 mg/Kg) was not antagonized with naloxone (0.25 mg/Kg, s.c.) pretreatment.
REFERENCES

The fact that hydroethanolic extract of Bacopa monnieri inhibits chemical-induced nociception and that it does not antagonize with naloxone suggests that the extract does not possess opioid-mediated antinociceptive activity. This finding is in contrast to the reports by vohora et al. 1997 and goorha et al. 1998.

In conclusion, this study suggests that the extract does not possess opioid-mediated antinociceptive activity. The wealth of India: Raw materials, Council of scientific and industrial research, New Delhi, vol.2, 1988; p. 2–3.

The authors are grateful to Dr. Muhammad Ibraheem, Department of Botany, University of Peshawar, Pakistan for the identification of the plant material and the support of the Ministry of Health and Ministry of narcotic control, Pakistan for granting permission to acquire morphine for the study. We are also thankful to Punjab Drug House (PDH), Lahore for the supply of morphine.
