ABSTRACT

A hydroethanolic extract (HE-ext) of Bacopa monnieri (BM) was studied for antinociceptive effect in the animal models of acetic-acid-induced writhing test and antilocomotive effect in mice. Standard centrally-acting analgesic, morphine (MP), and peripherally-acting one, diclofenac (Diclo), were also tested along with the extract for comparison. The extract exhibited significant antinociceptive effect (p < 0.001) in this test, not antagonized by the opioid receptor antagonist, naloxone (NLX) in a fashion similar to diclofenac. This excluded the involvement of opioids in the mediation of antinociceptive response of Bacopa monnieri. Moreover, the BM HE-ext exhibited highly significant antilocomotive (p < 0.0001) that was also unaffected by naloxone. These results indicate that Bacopa monnieri possesses antinociceptive and antilocomotive effect that may be mediated through non-opioidergic mechanism.

Keywords: Bacopa monnieri, Hydroethanolic extract, Antinociceptive activity, Acetic-acid-induced writhing test, Antilocomotive effect

MATERIALS AND METHODS

Bacopa monnieri (family: Scrophulariaceae) [1] also known as Bacopa monniera, water hyssop, Herpestis monnieri is a perennial creeping, succulent herb found in marshy areas of Indo-Pak subcontinent [2]. In India, it is commonly known as “Brahmi” as an ancient and renowned medicinal plant with legendary reputation as a memory vitalizer [3]. Bacopa monnieri is held in high repute to be the brain booster and is highly valued in conditions affecting CNS. In ancient traditional system of medicine, it is often prescribed for epilepsy, insomnia, and psychiatric disorders such as mental breakdown in Alzheimer’s disease [4], neuralgia, and memory loss [5]. It is known to possess cardiotonic, sedative, analgesic, anticonvulsant, anti-inflammatory [6], antioxidant [7], anticancer, antipyretic, laxative, diuretic, antistress [8], and anxiolytic [9] properties. In this study, we have examined Bacopa monnieri for antinociceptive and antilocomotive activity in animal models.

The extract exhibited significant antinociceptive effect (p < 0.001) in this test, not antagonized by the opioid receptor antagonist, naloxone (NLX) in a fashion similar to diclofenac. This excluded the involvement of opioids in the mediation of antinociceptive response of Bacopa monnieri. Moreover, the BM HE-ext exhibited highly significant antilocomotive (p < 0.0001) that was also unaffected by naloxone. These results indicate that Bacopa monnieri possesses antinociceptive and antilocomotive effect that may be mediated through non-opioidergic mechanism.
Chemicals and Drugs
Ethanol was obtained from Khazana Sugar Mills Mardan through proper channel. Diclofenac sodium was gratefully donated by Zinta Pharmaceutical Pvt, Peshawar, Pakistan. Morphine was secured through proper channel (PDH Lahore, Pakistan). Opioid antagonist, naloxone was purchased from Sigma, USA.
For experiments, all drugs and extracts were dissolved in water for injection.

Animals
Balb-C mice bred in the animal house of the Department of Pharmacy, University of Peshawar, were used in this study. Animals were housed in groups of eight in cages with sawdust bedding. Experiments were carried out during the light phase between 9.00 am and 3.00 pm strictly in accordance with procedures laid down under the Animal Scientific Procedure Act (1986). Both anti-nociceptive and locomotive studies were carried out on mice of either sex weighing 18-22 g. Control animals received equal volume of normal saline (0.9% NaCl). Animals were marked for their proper identification.

Procedures
Acetic-acid-induced writhing test
Balb-C mice of either sex (n=8) weighing 18-22 g were used. Animals were withdrawn from food and water 2 hours before the start of experiment. Writhing behavior was tested, in which 1% acetic acid (AA) was administered intraperitoneally (i.p.) and number of abdominal constrictions of control was subsequently recorded between 1- 30 mins. As shown in the Fig 1, hydroethanolic extract of Bacopa monnieri (80, 160 mg/kg) were administered orally (PO) 1 hour before administering 1% AA. For antagonism, naloxone (0.5 mg/kg body weight) was administered subcutaneously (s.c.) 5 minutes before AA administration. All drugs were administered in the volume of 0.1 mL/20 g i.p and 0.2 mL/10 g PO. Percent analgesia was calculated with the help of following formula:
% Protection = (1 - Mean no. of abdominal constrictions of treated drug / Mean no. of abdominal constrictions of control) * 100

Antinociceptive effect of morphine, diclofenac and hydroethanolic extract of Bacopa monnieri in acetic-acid-induced writhing test

Diclofenac (12.5 mg/Kg), or morphine (3 mg/Kg body weight) was administered subcutaneously (s.c.) 5 minutes before AA administration. All drugs were administered in the volume of 0.1 mL/20 g i.p and 0.2 mL/10 g PO. Percent analgesia was calculated with the help of following formula:
% Protection = (1 - Mean no. of abdominal constrictions of treated drug / Mean no. of abdominal constrictions of control) * 100

Results were analyzed by one-way analysis of variance (ANOVA) with post hoc tests for multiple comparisons and Student's t test. Effects were considered significant at p < 0.05.

Fig 1. Antinociceptive effect of diclofenac, morphine and hydroethanolic extract of Bacopa monnieri calculated as percent protection in acetic acid induced writhing test in mice. Each column represents mean ± S.E.M. (n=8). ***p < 0.01, **p < 0.001. Difference between treatment groups and saline control was analyzed by one way analysis of variance with Dunnett's post-hoc test.

Fig 2. The effect of naloxone on morphine and diclofenac induced antinociception calculated as percent protection in acetic acid induced writhing test in mice. Each column represents the mean ± S.E.M. (n=8). ***p < 0.01, values showed significant antagonism by naloxone as compared to morphine treated groups when analyzed by Student's t test.
Effect of naloxone on BM HE-extract induced antinociception calculated as percent protection in acetic acid induced writhing test in mice. Each column represents mean ± S.E.M. (n=8). Student’s t-test revealed no significant difference between two comparison groups (p > 0.05).

Effect of morphine and hydroethanolic extract of Bacopa monnieri after acute administration on locomotor activity in mice. Each column denotes mean line crossings ± S.E.M. (n=8). ***p < 0.0001, values were significantly different as compared to control (ANOVA with Dunnett’s post hoc test).

### Discussion

The nociceptive response in the acetic-acid-induced writhing test results from the liberation of histamine, kinins, Prostaglandins, serotonin and substance P. The nociceptive activity of acetic acid may be due to cytokine release, such as TNF-α, interleukin-1β and interleukin–8, by resident peritoneal macrophages and mast cells [12]. It has been reported that intraperitoneal administration of acetic acid causes an increase in the concentration of glutamate and aspartate in the cerebrospinal fluid [13].

The production of prostaglandins [14,15] results through the action of the constitutive enzyme cyclooxygenase-1 (COX-1) and its isof orm COX-2 which produce pain [15,16]. Induction of this mechanism through COX enzymes and stimulation of these sensory pathways in the mouse peritoneum incites a visco-somatic reflex and the abdominal constrictions observed in response to an allogenic agent such as acetic acid [15,16]. Acetic-acid-induced writhing assay is sensitive procedure to evaluate peripherally and centrally...
centrally acting analgesics [17-22] and sensory afferents [23]. When activated by appropriate agonists, these receptors depress the generation of pain impulses, in some instances there being an interaction between α2-adrenoceptors and opioid receptors in the mouse peritoneum [10,11,23,24].

In this study, morphine, diclofenac and hydroethanolic extract of *Bacopa monnieri* produced significant antinociceptive effect in acetic-acid-induced writhing method. In order to investigate further the mechanism of antinociceptive effect, the extract of *Bacopa monnieri*, and standards diclofenac and morphine were examined in the presence of naloxone. Naloxone in contrast to morphine, the antinociceptive effects of HE extract and diclofenac were not antagonized with naloxone. The fact that hydroethanolic extract of *Bacopa monnieri* inhibits chemical-induced nociception and that antinociception is not antagonized with naloxone suggests that the extract does not possess opioid-mediated antinociceptive activity. This finding is in contrast to the report by Vohora et al. [25] that the extract does not possess opioid activity.

Opioids have been known to possess sedative effect [25,27] and that is believed to due their action at opioid receptors within the central nervous system [28]. Naloxone has been known to antagonize the sedative effect of opioid by acting on opioid receptors [29]. This study has also revealed that hydroethanolic extract of *Bacopa monnieri* was able to promote a motor depressant effect in mice. Thus, administered acutely at the dose level of 80 mg/Kg body weight, the extract exerted significant decrease in locomotor activity, indicating sedative properties of the extract.

Furthermore, the anti-locomotor effect of the extract was not antagonized with naloxone, excluding the involvement of opioid receptors in the mediation of anti-locomotor activity of the extract. However, naloxone pretreatment antagonized the anti-locomotive activity of morphine at the dose of 10 mg/Kg.

In conclusion, this study has demonstrated that hydroethanolic extract of *Bacopa monnieri* possesses antinociceptive effect and inhibited the locomotor activity involving a non opioidergic mechanism as the both activities were not affected by opioid antagonist, naloxone.

**ACKNOWLEDGMENTS**

The authors are gratefully thankful to Dr. Muhammad Ibrah, Department of Botany, University of Peshawar, Pakistan for the identification of the plant material and the support of the Ministry of Health and Ministry of narcotic control, Pakistan for granting permission to acquire morphine for the study. We also thankful to Punjab Drug House (PDH), Lahore for the gift of morphine.
