ABSTRACT

The objective of the study was to evaluate the cytotoxic effects of aqueous fruit extract of *Cucumis melo* in human prostate cancer cell line (PC-3) using MTT and neutral red assays. The crude aqueous extract of *C. melo* was prepared by cold maceration method, filtered, concentrated and tested on PC-3 cell line. Dose-dependent cytotoxic activities were exhibited by human prostate carcinoma PC-3 cell line. As the dose of the extract increased, the number of viable cells decreased. This confirms the anti-cancer and cytotoxic potential of the fruit of *C. melo*.

Keywords: Cytotoxicity, MTT assay, Neutral red assay, Human prostate carcinoma cell lines (PC-3), *Cucumis melo*

Carcinoma of the prostate gland is the malignancy of the male genitourinary tract and is a disorder in older men, with mean age at presentation about 70 years. Treatment of Kidney stones, cancer, cardiovascular disease and hypertension are associated with the presence of symptoms. The risk factors associated with prostate cancer and prostate cancer and its development. Two prostate cancer susceptibility genes that have been identified are the RNASEL and MSR1 genes both of which are involved in immune system. *C. melo* is also rich in antioxidants, with prostate cancer at an early age. Prostate cancer risk increases with number of first degree relatives who are affected, and also if the affected relatives diagnosed at an early age. Environmental factors. The magnitude of familial risk increases with number of first degree relatives who are affected. Prostate cancer is associated with an inherited predisposition to prostate cancer and its development. Two components found in the essential non-metallic trace elements (Selenium) and antioxidant properties (*β*-carotene, lentin, xanthin and cryptoxanthin). These antioxidants have the ability to protect cells and structures in the body from oxygen free radicals, hence offer protection against prostate, colon, breast, lungs, endometrial and pancreatic cancer. The *Cucurbitaceae* family includes several species of cultivated plants that has great economic importance. *Cucumis melo* fruit is round in shape, tan to greenish tan with a rough texture and orange pink flesh. It is well known for its sweet taste and fragrance. It is native to Persia, Armenia, etc. Many phytochemicals having antioxidant properties. The active principles in the vegetable potential benefits are present in *C. melo*. It is rich in extracts are principally water soluble or lipophilic.
Effect of *Cucumis* on prostate cancer

antioxidant molecule. Most of these plant extracts were mixed with strained liquid, filtered to make a clear solution and concentrated.

MATERIALS AND METHODS

Plant material

*C. melo* fruits were collected from local fruit stalls of Cherthala, Alappuzha District in the month of November 2012 and authenticated at Department of Environment Sciences, Mahatma Gandhi University, Kottayam, Kerala, India. In vitro methods were used for assessing the cytotoxic activity and they were in accordance with the guidelines of Institutional Animal Ethical Committee (IAEC).

Reagents for phyto-chemical analysis

Bismuth nitrate, Nitric acid, Potassium iodide, Sodium carbonate, Mercuric chloride, Sulphuric acid, Hydrochloric acid, Sodium hydroxide, Ferric chloride, Alpha naphthol, Copper sulphate, Zinc chloride 3-(4,5)-dimethyl thiazole-2-yl)-2,5-diphenyl tetrazolium bromide (MTT), Isopropanol, Phosphate buffer saline (PBS), Dimethyl sulfoxide (DMSO), Calorimeter, Flavonoids.

Phytosterols

1 M Potassium dihydrogen phosphate, CO₂ Incubator, PBS, Elution medium ethanol/acetic acid.

Spectrophotometer.

MTT assay and neutral red assay

PC-3 cell line-PC-3 prostate cell lines purchased from National centre for Cell Sciences (NCCS), Pune, Maharashtra, India. 1 M Potassium dihydrogen phosphate, CO₂ Incubator, PBS, Elution medium ethanol/acetic acid.

Preparation of extract: cold maceration

The fruit was washed and the outer skin was peeled off. The remaining fleshy part was cut in to small pieces. Then it was soaked in water for seven days and was kept in a dark place. During this period shaking was done occasionally. After seven days, the liquid was added. Formation of yellow colour indicated the stained and marc was pressed. The expressed liquid presence of glycosides.

**Methods**

**Phytochemical analysis**

The following tests were carried out to analyze the possible phytochemicals present in the aqueous extract of *C. melo*.

Alkaloids-Dragendorff's test

Eight gram of bismuth nitrate was dissolved in 20 ml nitric acid and 2.72 g of potassium iodide in 50 ml water. These were mixed and allowed to stand. When potassium nitrate crystals out, the supernatant was discarded off and made up to 100 ml with distilled water. The alkaloids were regenerated from the precipitate by treating with sodium carbonate followed by extraction of the liberate base with ether. To 0.5 ml of alcoholic solution of extract was added 2.0 ml of hydrochloric acid. To this acidic medium, 1.0 ml of reagent was added. An orange red precipitate was produced immediately indicated the presence of alkaloids.

Mayer's test

The amount of 1.36 g mercuric chloride was dissolved in 60 ml of distilled water and 5 g of potassium iodide in 10 ml of water. The two solutions were mixed and diluted to 100 ml with distilled water. To 1 ml of acidic aqueous solution of extracts, a few drops of reagent was added. Formation of white or pale orange precipitate showed the presence of alkaloids.

Wagner's test

In a test tube containing 0.5 ml of alcoholic extract, 5-10 drops of dilute HCl and a small piece of ZnCl₂ or Mg were added and the solution was boiled for few minutes. In the presence of flavonoids, reddish pink or dirty brown color was produced.

**Flavonoids**

In a test tube containing 0.5 ml of alcoholic extract, 5-10 drops of dilute HCl and a small piece of ZnCl₂ or Mg were added and the solution was boiled for few minutes. In the presence of flavonoids, reddish pink or dirty brown color was produced.

**Glycosides**

A small amount of alcoholic extract was dissolved in 1 ml of water and the aqueous NaOH solution was done occasionally. After seven days, the liquid was added. Formation of yellow colour indicated the stained and marc was pressed. The expressed liquid presence of glycosides.

**Diphenyl tetrazolium bromide (MTT) by mitochondrial succinate dehydrogenase.**

**Presence of alkaloids (+)**

**Presence of Flavonoids (+)**

**Presence of phytosterols (+)**

**Absence of glycosides (-)**

**Absence of carbohydrates (-)**

**Absence of proteins (-)**

**Absence of saponins (-)**

**Tannins-Ferric chloride test**

To 1-2 ml of aqueous extract, few drops of 5% aqueous ferric chloride solution was added. A bluish black color which disappears on addition of a few ml of sulphuric acid, there is no formation of yellowish brown precipitate.

**Sugars-Molisch’s test**

In a test tube containing 2 ml of aqueous extract, 2 drops of freshly-prepared 20% alcoholic solution of α-naphthol was added and mixed. To this solution, 2 ml of conc. Sulfuric acid was added so as to form a layer below the mixture. Formation of red violet ring at the junction of solution and its disappearance on the addition of an excess solution indicated the presence of carbohydrates.

**Proteins-Biuret’s test**

In a test tube containing 2 ml of test sample, 2 ml of 10% NaOH is added and mixed well. Then 0.1% CuSO₄ solution is added. A violet or pink colour indicated the presence of proteins.

**Saponins-Froth Test**

Few ml of the extract is transferred into a test tube and shaken vigorously then is left to stand for 10 min. A thick persistent froth indicated presence of saponins.

**Neutral red assay**

The neutral red cytotoxicity test was based on the ability of living cells to uptake and bind neutral red (NR). NR was a positively-charged dye that easily diffuses through the cellular membrane of the cells, accumulating in the cellular cytoplasm and stores in the acidic environment of lysosomes. The principle of the test consists in the fact that NR are able to absorb and bind only with live cells while this ability declines in damaged or dead cells. The amount of accumulated NR was thus directly proportional to the amount of live cells.

**MTT assay**

MTT is a colorimetric assay that measures the reduction of yellow 3-(4, 5-dimethylthiazol-2-yl)-2, 5- in the cell culture. The pH of the neutral red solution...

Results

The medicinal value of these plants lies in some chemical active substances that produce a definite physiological action on the human body. The most important of these bioactive constituents of plants are alkaloids, tannins, flavonoids and phenolic compounds [8]. The Phytochemical screening of the aqueous extracts of plant sample revealed the presence of alkaloids and flavonoids and phytosterols (Table 1) [9].

Cytotoxic studies

MTT results showed that 1000 µg/ml aqueous extract of *Cucumis melo* showed 67.27% (Table 2, Fig 1) while the neutral red uptake assay showed 66.27% viability (Table 3, Fig 2). The photograph of PC-3 cell line is taken using inverted illuminating microscope while the control received vehicle treatment groups were received *C. melo* at a conc. 100µg/ml and 1000 µg/ml (Fig 3). The results indicate that the crude aqueous extract of *C. melo* on PC-3 cell lines had shown a dose-dependent anti proliferative effect. The IC₅₀ values of MTT and Neutral red assays were found to be 1470 and 1860 µg/ml respectively (Figs 4 and 5).

Discussion

Metastatic prostate carcinoma is associated with a high morbidity and mortality rate with a medium survival of approximately, 12–15 months. Available treatment alternatives include radiotherapy after radical retropubic prostatectomy, radical prostatectomy, external beam radiation, prostate brachy therapy, and androgen ablation of the prostate. Until recently, despite androgen suppression, no cytotoxic agent has been able to change the progression of metastatic prostate cancer. Androgen ablation therapy remains the main course of treatment with advanced disease. However, it has no effect on hormone-independent cancer cells. Chemotherapeutic agents result in less than a 10% response in advanced prostate carcinoma, in part due to increased resistance of androgen-independent cells to apoptosis. However, the severe side effects of chemotherapy have remained a major problem.

In recent years considerable efforts have been made to identify naturally-occurring compounds and related synthetic agents can prevent the development and recurrence of cancer. A wide variety of natural food and food products can induce apoptosis in various tumor cells. There is strong evidence supporting the positive role of some natural materials and medicinal plants in oncology and their ability affect all phases of tumorogenic process. Therefore, it is important to screen the natural products either as crude extracts or as isolated components for apoptotic properties to identify potential anti-cancer compounds. Over 60% anti-cancer agents currently used are derived from natural sources, including plants, marine organisms and micro-
organisms and they offer an opportunity to study the molecular mechanisms of tumorgenesis.

Cucurbitaceae plants are highly useful as they have good potential against many health ailments. In the present study, the phytochemical screening of the aqueous extracts of plant sample revealed the presence of alkaloids and flavonoids and phytotherols. These phytoconstituents may be responsible for various activities. Flavanoids are diverse family of compounds commonly found in fruits, vegetables and honey. Flavonoids are generally safe and associated with low toxicity, making them ideal candidates for cancer chemopreventive agents. MTT results and neutral red uptake assay confirm dose-dependent anti-proliferative effect of crude aqueous extract of Cucumis melo on prostate cancer cell lines. As the dose of the extract increases, the number of viable cells decreases and confirms the cytotoxic activity.

It is concluded that the aqueous extract of C. melo was found to possess dose-dependent cytotoxic activity on metastatic human prostate cancer cell lines PC-3. Further studies are warranted to explore the antitumor effect of C. melo and also the active principles could be isolated and investigated.
