ABSTRACT
Green tea used for year has a popular cancer preventive activity. Researchers have showed green tea inhibited growth of cancer in the animals. This research has been done with awareness of positives effect of green tea, which is approved by researchers and the importance of treatment of opened skin wound. This work has been done experimentally. There were 56 male mice in 7 different groups. Different dose of water and alcohol such as 50, 150 and 300 μL were injected. After anaesthetizing the mice, skin wound was created on the back of the mice by a 6-mm punch. While the mice in control group were treated by normal saline, water and alcohol extract of green tea was injected around the wound on the back of each mouse. The dimensions of ulcers and the recovery percent of the wound in the 1st, 3rd, 5th, 7th, 10th, 13th and 15th day of study were measured. Furthermore, the needful time for recovery was evaluated. Some histological studies were done as well. Two Specimen of wounds were supplied at 4th, 7th and 15th day of the study. In this way, fibroblasts, inflammation, epithelium and endothelial cell of blood vessels from the wounds were studied. The results show that there are no significant differences among control, water and alcohol groups in recovery processes (p > 0.05). Evaluation of recovery processes showed there were significant differences among these groups on 7th day of study (p < 0.01). Evaluation of recovery processes showed there were significant differences among three injected doses of study (p < 0.001). The degree of differences in fibroblasts, inflammation and epithelium distortion in different days for 6 groups (p < 0.05) was meaningful. According to these findings, although both water and alcohol extracts of green tea speed up the wound healing, there isn’t any difference between the uses of water or alcohol extracts.

Keywords: Green tea, Wound healing, Water and Alcohol extract, Race NMRI

Wound healing, or wound repair, is an intricate process in which the skin (or another organ-tissue) repairs itself after injury. The classic model of wound healing is divided into three or four sequential, yet overlapping phases: hemostasis (not considered a phase by some authors), inflammatory, proliferative and remodeling. Upon injury to the skin, a set of complex biochemical events takes place in a closely orchestrated cascade to repair the damage [1]. Green tea is made from Camellia Sinensis [2]. Leaves of this plant are processed with minimal oxidation. It is mainly used in Asia specifically in China [3-4]. There have been extensive researches on the effects of green tea and results have been surprisingly pleasing. Some of the major potential benefits of green tea include; anti-Cancer properties, increases in metabolic rate, anti-diabetes effect, enhancement of mental alertness, improvement of immune system, improvement of quality of life for HIV-infected...
Aqueous extract digital camera and grams of green tea powder was placed into sufficient water and food were in the wound surface was treated ground to a powder by 12 et al. January 5

soxhlet using investigated. The macroscopic study of wound diameter average between control and treatment group on days 1, 3, 5, 7, 10, 13 and 15. (p < 0.001)

In this experimental research, 56 male mice of NMRI race with average weight of 25-35 grams were studied. The mice were held in 7 cages in Professor Torabi Nejad Research Center in Isfahan with light cycle of 12 hours darkness and 12 hours light in 22 ± 2°C. In this period, sufficient water and food were in hand of animals and they were randomly classified to control and experimental groups.

Green tea extract was prepared using soxhlet instrument. The green tea leaves were studied by Isfahan University and were transferred into laboratory. Then using electric mill, they were grind to a powder. Forty grams of green tea powder was placed into filtration paper and were transmitted to a specific container. In order to produce water extract, 400 milliliters of purified water was added and in order to produce alcoholic extract, 400 milliliters of 85% methanol was added. After producing the extract by soxhlet, it was dried and concentrated in rotary evaporator and then in 48-hour incubation in 70°C Bombay. In next stage, 2 g of each extract (alcoholic or aqueous) was solved in 100 mL normal saline and then by 50, 150 and 300 mL of 2% alcoholic extract respectively, groups 2, 3 and 4: the wound surface was treated with 50, 150 and 300 mL of 2% aqueous extract respectively; groups 5, 6 and 7: the wound surface was treated with 50, 150 and 300 mL of 2% alcoholic extract respectively. For microscopic evaluation, sampling and tissue study was carried out. On days 4, 7 and 15, the mice were killed by smelling ether in air. Then, two samples were taken from wound tissue and surrounding skin which were placed inside 10% Formalin solution. The tissue processing and molding was done by paraffin and wax and the German microtome with firm blade of LEItz to develop width cuts including skin, bed with the thickness of 4 microns. The cuts were painted by Haematoxylin and Eosin (H&E) coloring methods and edematous cell, fibroblasts and sweating sections were recognized through quality method. The wound size measurement were recorded. For microscopic study, on days 1, 3, 5, 7, 10, 13 and 15, the length measurement method of wound and imaging with digital camera was used for all groups. The development of wounds was assessed and the wound stages according to imaging digital camera and size measurement were recorded.

In order to make a wound in animal, first the mouse became comatose with ether and then its back hair was shaved. After immersing the skin with betiding, with 6-millimeter punch and in accordance to surgery principles, a 6-millimeter wound was developed. The wound depth was full skin thickness and the surgery day was named the day zero. After making the wound, in order to prevent potential putrefaction, 0.2 mg penicillin and 0.2 mg gentamicin were injected.

Rating 1: The tissues with no repeating epitheilisation and fibrosis tissue but with the low numbers of vessels and extreme edema.

Rating 2: The tissues with repeating epithelisation, treatment group on the days 1, 3, 5, 7, 10, 13, and 15 low quantity fibrotic tissue, low number of vessels and has been illustrated in Fig 1. There is a meaningful extreme edema difference between groups (p < 0.001).

Rating 3: The tissues with epithelisation and The microscopic results show that edema, fibroblast fibroblast in small limit and also low number of vessels and epithelium amount in mice received aqueous or and low edema. Alcoholic extract did not have a meaningful difference.

Rating 4: The tissues with no edema and the The edema, fibroblast and epithelium amount were medium number of epithelisation and fibroblast significantly different in groups received aqueous or

Rating 5: The tissues with complete epithelisation, alcoholic extracts when compared with control group (p complete fibrotic tissue development, high number of < 0.001). In contrast, the blood vascular amount were not significantly different in groups received aqueous or

All the data were analyzed using one-way ANOVA, alcoholic extracts when compared with control group by SPSS statistical software. The p values < 0.05 were (Table 1).

Results

There are 150 reports from in vitro and in vivo The average wound diameter in control group was studies in the effects of green tea on skin. The primary

4.42 ± 1.66 mm, in the group which received the focuses of these studies are the chemical carcinogens or alcoholic extract of green tea was 3.81 ± 1.74 mm, and photo carcinogens in animals [9]. Generally, The

tea, it was 3.93 ± 1.69 mm. No meaningful difference between 3 groups was observed (not significant). The compounds: catechin, gallaocatechin, epicatechin, average of wound diameter among control and epigallocatechin, epicatechin gallate, as well as

apigallocatechin gallate (also referred to as EGCG), healing [11]. The other researchers showed that polyphenols cause the infusion, contrast and anti-tumor, anti-edema, anti-virus, anti-ratification, anti-propagation in epidermis Keratinocytes [9]. Catkins are oldness, and lowering the blood sugar [7-10]. Chemicals also from polyphenol group that have anti-oxidant and anti-tumor activity, for example, EGCG. EGCG prevents collagenase activity and have role in prevention of scar which is the beginner of antioxidant theory [11]. EGCG is the prevenor of tumor growth in chest, word, the earlier start of revival phase of collagen lung, liver, sweetbread, stomach, pancreas, skin, cyst, synthesis take place in this stage and collagen groups and prostate [11]. EGCG is the preventor of secretion of with more diameter are constructed and the width link chymotrypsin, tumor necrosis factor alpha and glucose-6-phosphate dehydrogenase in liver [11-12]. This causes the wound after healing to look like the tissue.

In this study, there is not a meaningful difference before woundling and prevents the white and ugly scar.

between the alcoholic and aqueous extract of green tea. In addition, increasing blood and oxygen availability to in studied groups. This finding is important for two: wound location takes place through widening the veins reasons. Firstly, using green tea extract doesn’t have reasons [19]. Researches show that green tea reduces blood any relationship with aqueous or alcoholic treatment. Sugar, blood lipids, blood pressure, heart disease. Secondly, in this study, the effect of aqueous and reduction, heart bit and also vein widening [11,20]. This alcoholic variables is excluded. In the current study, on influences on the practical capacity of fibroblasts, fourth day, as the edema stage indicator is considered as synthesis increase in collagen fibers and increase in the wound treatment process [13], the excess of edema wound insistence because of increase in collagen in treatment group is meaningfull less that of control content and because fibroblasts are responsible for group (p < 0.001). This shows that the green tea makes developing collagen. So we can conclude that green tea the edema stage of treatment process faster and (polyphenol, catechin and EGCG) cause the propagation therefore the wounds heal faster. In addition, injecting fibroblasts and influence the practical capacity of fibroblasts and increase the synthesis of fibro Collagen meaningful increases in fibrous tissue and reduction in [20]. The higher the injection dose (300 mL), the higher the edema in seventh day of study in comparison to these, the meaningful number of fibroblasts [9]. The research control group. This meaningful increase of treatment of Madham et al. show that catechin polyphenol and group fibrous in considering their role in following: EGCG prevent the collagenase activity against issues are important and indicate the positive effect of Collagens [18]. In fact, Catkin and EGCG prevent the green tea on distribution phase of wound treatment action through linking with hydrogen and reaction with process. Hydrophobic with collagens prevent its activity and play 1. Fibroblasts are responsible for synthesis of a role in collagens registration [18]. Research of Young matrix components of primary outer cell of wound bed also shows the prevention of collagen destruction including fibronectin and proteoglicans that provide a cell and collagenase activity through setting reactions of proper substrate for immigration and propagation of cellular signal by EGCG [19].

The broad studies during past decades show that the 205 cells [14]. The healing percent and also in reduction of required time role of scavenger in special conditions and thus it for complete healing. Reduction in edema resulted in implements its preventing effects on bacteria and virus speeding the wound stage. In 2004, Bayer and colleagues growth. In this regard, preventing effect of green tea show that polyphenols prevent the discharge of gamma-(Camellia Sinensis) and black tea on the bacteria growth interferon and have anti edema, anti oldness and wound has been shown [21]. It is possible that green tea

Green tea effects on wounds healing

...improve the healing speed of wound. It has been reported that antibiotic medicine speeds the healing of wounds will lose their integrity and will open. Because the wound by infection control [21]. In this study the amount of collagen synthesis will exceed the exterior symptoms of infections are not observed in reconstruction of it [29]. In other hand, vitamin C is control group. Therefore, it seems to be actions other required for construction of veins, immigration of that preventing the wound infection for green tea macrophages and correct function of nutrofiles [30], fastening the wound improvement. Bayat et al. explain Some studies show that green tea is a rich resource of the ultrasound treatment effect and gel on healing the vitamin C and includes 18 amino acids including lysine wound section and they believe that wet wound is the and proline [9,12,20]. Lack of vitamin B6 (pyridoxine) speeding factor of wound healing process. In current damages this phenominal link process. Lack of vitamin study, the wounds were daily wetted by the alcoholic B2 (riboflavin) disorders the wound healing process and aqueous extract. [29]. In other hand, B group vitamins are cofactors for...The experimental studies on animals show that the enzyme reactions and are required for correct function localized usages of epidermal growth factors have an effect of blood cells and construction of antibodies [30]. The important influence on speed of epidermal healing results have shown that green tea includes vitamins B1, wounds with relative thickness and burnings. The usage B6 and B9 [9,12,20]. Therefore probably we can of this material on human wounds also has similar conclude that mentioned issue is one of the factors, effects and its usefulness has been proved [22]. The speeding the healing process in treatment group. epidermal healing is a complex phenomena from which. It seems that one of the functions of green tea that the rest epidermal cells are propagated so there will help helps the healing of wound is the positive effect of another healthy epidermis. The molecular actions that polyphenols, Catechin, Glycoproteins, EGCG and set the natural epidermal healing are not completely vitamins. The increased speed of healing has many known, but it seems that the peptide growth factors that effects regarding the economic and hygiene. Higher the act through autocrin or paracrin mechanisms have sped of wound healing, the less the wound infection important role on them [23-25]. In 2003, Chung et al. and an increased speed in all the process of wound showed that the green tea extract (EGCG) cause the healing. In all of current study for the first time it was epidemic creationism survival in human. In 2003, shown that green tea extract can speed the wound Bollag et al. proposed cellular propagation and healing by healing process of male mice NMRI skin. Of wound through polyphenols of green tea. Many numbers of growth factors are known including the...REFERENCES

...53 amino acids that DNA and protein is activated by the mRNA [25]. It has been shown that the peptide growth factors increase significant proliferation of cells in wounds with relative wounds and also increase traction influence on Mesenchyme cells [26]. In fact, the growth factors of exterior peptide will increase other production of growth factors like transforming growth factor which is revealed from plackets and macrophages, indirectly activates the healing and improving the wound [27,28]. Without considering the structure, immediate facing of cells during healing with growth factors of epidermal, increases the epithelial [28]. Kwon et al. stated that...EGCG motivates the growth of human hair through proliferation and has Anti-apoptosis effects on DPCs [29,30]. The histology of wound showed that proliferation of cells increase that is probably because of chemical combination of green tea and epidermal growth factors. In addition, role of vitamins on wound healing process and the relationship of green tea contents with them can be considered. Lack of vitamin C is important...In delay of wound healing. In such patients, wound healing in fibroblasts stage is stopped. In this state, even when the number of fibroblasts is natural, they do not produce sufficient collagen. Vitamin C is required for the ion link of (OH) with amino acid of proline and lysine and hydroxy-lysine, fibrils of collagens will not obtain the width links. In extreme Scurvy, not only the new...
